 Kathmandu, Nepal  [abhizer.com](https://abhizer.com)

As a prospective PhD student, my research interests currently span **programming languages, compilers** and **databases**. In databases, I am particularly intrigued by Incremental View Maintenance and the structured testing of database systems through query synthesis. In programming languages, while I am still exploring the specific problems I want to focus on, I deeply enjoy the field and have a strong appreciation for languages like Rust. I admire the functional flavor it brings, along with its robust build system, which I believe significantly enhances developer productivity. Beyond these areas, I am also open to exploring research opportunities in Operating Systems and Networking, as I find these fields offer compelling challenges and significant potential for impactful contributions.

## EDUCATION

- 
- OCT 2019 – AUG 2024 **Bachelor of Science**, *Deerwalk Institute of Technology (DWIT)*, Kathmandu  
Computer Science & Information Technology
- MAY 2017 – JUNE 2019 **Cambridge International A Levels**, *St. Xavier's College (SXC)*, Kathmandu  
Courses : Computer Science, Physics, Chemistry, Mathematics

## PUBLICATIONS

- 
- › Mihai Budiu, Leonid Ryzhyk, Gerd Zellweger, Ben Pfaff, Lalith Suresh, Simon Kassing, **Abhinav Gyawali**, Matei Budiu, Tej Chajed, Frank McSherry, Val Tannen, “**DBSP : Automatic Incremental View Maintenance for Rich Query Language**,” accepted for publication in **The VLDB Journal**.  
In this paper, we redefine Incremental View Maintenance and propose a solution using DBSP. DBSP is a simple but expressive language for describing computations over data streams. We give an algorithm for converting a DBSP program into an incremental program. Finally we demonstrate how to build upon DBSP to support rich query languages like SQL. A practical implementation of this lies in  [github.com/feldera/feldera/tree/main/sql-to-dbsp-compiler](https://github.com/feldera/feldera/tree/main/sql-to-dbsp-compiler)
  - › **Abhinav Gyawali**, “**SocketDB : DBMS with Data Streaming via WebSockets**,” accepted for publication in **Deerwalk Journal of Computer Science and Information Technology, 2025**.  
In this paper, I describe my final year project, SocketDB, a lightweight SQL database that allows clients to subscribe to real-time updates through WebSockets. This paper argues that, in certain cases, this approach would reduce the load on the application server from constant requerying of the data by the client.

## PROFESSIONAL EXPERIENCE

## PROJECTS

### DBSP

PRESENT

[github.com/feldera/feldera/tree/main/crates/dbsp](https://github.com/feldera/feldera/tree/main/crates/dbsp)

DBSP is a computational engine for continuous analysis of changing data. With DBSP, a programmer writes code in terms of computations on a complete data set, but DBSP implements it incrementally, meaning that changes to the data set run in time proportional to the size of the change rather than the size of the data set. This is a major advantage for applications that work with large data sets that change frequently in small ways.

Incremental View Maintenance Rust

### SOCKETDB

2024

[github.com/abhizer/socketdb](https://github.com/abhizer/socketdb)

SocketDB is a lightweight SQL database that enables real-time updates through WebSockets. Clients can subscribe to query results and receive updates whenever the underlying data changes. This project allowed me to explore the intersection of database design and real-time communication, providing valuable insights into building efficient and responsive systems.

Rust Databases WebSockets

### NYX-LANG

2023

[github.com/abhizer/nyx-lang](https://github.com/abhizer/nyx-lang)

Nyx-lang is a statically typed, tree-walking interpreted language with a type-checking mechanism to ensure safety and correctness. Working on this project deepened my understanding of compiler design and type systems, while encouraging me to approach language implementation from a structured and reliable perspective.

Rust Compiler Interpreter Type Checker

### LOOGLE-RS

2023

[github.com/abhizer/loogle-rs](https://github.com/abhizer/loogle-rs)

Loogle is a "Local Google" like search engine based on Term Frequency - Inverse Document Frequency (TF-IDF). Users can search for text in their search space and Loogle returns a sorted list of the files based on the page rank.

Rust Search Engine TF-IDF

[github.com/abhizer/monkey-rs](https://github.com/abhizer/monkey-rs)

Monkey-rs is my take on the concepts from the Writing an Interpreter in Go book. This project was a pivotal learning experience, helping me become more comfortable with Rust and introducing me to the challenges and rewards of interpreter development. It marked an important step in my growth as a developer.

Rust Interpreter

## AWARDS & CERTIFICATIONS

---

- 2021 **DWIT Merit Based Scholarship** : Class of 2023, DWIT, Nepal
- 2020 **DWIT Merit Based Scholarship** : Class of 2023, DWIT, Nepal
- 2020 **AWS Educate Student Ambassador**
- 2019 **TEDxMaitighar** : Organizer
- 2017 **Red Hat Certified Engineer** : (170-197-891)
- 2017 **Red Hat Certified System Administrator** : (170-197-891)
